

During Stay Service Engine BRD

1. Summary

A cloud-based web module accessible via the Vibe House Guest Interface (PWA) designed to automate in-house guest requests. The system handles free operational requests, dynamically checks inventory for borrowable items, and enforces a strict prepaid flow for chargeable commodities and services before routing tasks to the operational staff.

(Note: Bed/Room upgrades and third-party luggage storage are handled manually on-site and are excluded from this automated flow).

2. Use Case: During Stay Services (In-House Guest Portal)

2.1 Overview

Guests access the service dashboard from their smartphones while on-property. Depending on the request type (Free, Borrowable, or Chargeable), the system either directly routes a task to the staff or initiates a mandatory payment gateway sequence before task creation .

2.2 Detailed Action Sequence

Step	User Action (Click/Type)	System Response / Backend Logic
1. Auth	Open PWA (Guest is already signed in).	Validate active in-house status via DB/PMS.
2. Dashboard	Click on "Room Requests" or "Maintenance".	Load service catalog categorized by Free, Borrowable, and Chargeable .
3. Selection	Select desired service (e.g., Towel, Room Cleaning, Iron).	Logic Branch: • If <i>Free</i> : Skip to Step 8. • If <i>Borrowable</i> : Query internal DB for real-time availability.

		If <i>Chargeable</i>: Add to Cart.
4. Validation	<i>(For Borrowables)</i> View availability status.	If internal DB stock > 0, allow selection. If stock = 0, display "Currently Unavailable" toast.
5. Checkout	<i>(For Chargeable)</i> Click "Proceed to Pay".	Generate unique order ID. Redirect to Razorpay Payment Gateway.
6. Payment	Complete transaction via UPI/Card/Wallet.	Await webhook confirmation. Update DB to SUCCESS .
7. PMS Sync	<i>(Background Process)</i>	Push paid items to eZee PMS folio and mark as 'Paid'.
8. Ops Trigger	<i>(Background Process)</i>	Auto-create a task in the Staff Task Dashboard . Assign to available staff and initiate SLA timer .
9. Finish	View "Request Confirmed" screen.	Send guests an in-app notification tracking the task status.

3. Service Catalog & Routing Logic

3.1 Chargeable Services & Commodities

These items require the guest to pass through the payment gateway. A staff task is *never* generated until the payment is 100% successful.

- **Items:** Towel, Blanket, Toiletries, Locker, Laundry pickup .

3.2 Free Maintenance & Operational Requests

These requests bypass the payment gateway and immediately trigger a ticket in the Staff Task Dashboard.

- **Housekeeping:** Room cleaning, Washroom cleaning, Garbage clearance, Linen change .
- **Maintenance:** WiFi, Hot water, AC, Other issues .
- **Assistance:** First Aid, Staff assistance, Lost & found .

3.3 "Subject to Availability" Borrowables (Free)

These items are free but heavily restricted by inventory limits.

- **Items:** Iron, Hair dryer, Umbrella .
- **Logic:** The PWA checks the internal Vibe House Database. If stock exists, the request is allowed, and stock is temporarily decremented (-1) while checked out to the guest. Once staff verifies the item is returned, the stock is incremented (+1).

4. Payment System Requirements

To ensure revenue integrity and service accountability, all chargeable transactions within the "During Stay" module must strictly adhere to the following workflow :

Core Requirements:

- **Payment Methods:** Support UPI, card, wallet.
- **Prepaid Only:** Be prepaid (no pay-later for small items).
- **Invoicing:** Auto-generate invoice line item.
- **Folio Sync:** Auto-post to PMS folio.
- **Task Gating:** Trigger operational task **only** after successful payment.

Example Flow:

1. Guest purchases Bath Towel ₹129
2. Payment success confirmation received
3. Housekeeping task created automatically
4. Auto-assigned to available staff
5. 15-minute SLA timer initiated
6. Guest notified upon completion

5. Technical Specifications & Error Handling

5.1 System Integration

- **Internal DB (Availability Check):** The internal database is the master ledger for borrowable items (Iron, Hair dryer). It prevents double-booking of scarce free resources.
- **eZee PMS (Financial Ledger):** The PMS is updated exclusively for chargeable items via API. Free requests and borrowables are tracked internally but not pushed to the PMS.
- **Staff Task Dashboard:** Acts as the fulfillment endpoint for all 3 categories (Free, Borrowable, Chargeable).

5.2 Edge Case Handlers

- **Failed Payment:** If a guest attempts to buy a towel but closes the Razorpay window, the DB logs a **FAILED/ABANDONED** status. No PMS update occurs, and no staff task is created.
- **Borrowable Item Hoarding:** If a guest has already checked out an Iron, the system logic will prevent them from requesting a second one until the first is marked "Returned" in the Staff Dashboard.
