

Pre-Arrival Upsell Engine & Add-On Cart BRD

1. Summary

A cloud-based web module designed to increase ancillary revenue before guest arrival by offering commodities and services (Upsells). The system allows signed-in guests to seamlessly purchase add-ons via Razorpay, which are then automatically synchronized with the eZee PMS and internal Vibe House databases.

2. Use Case: Pre-Arrival Add-on Cart (Remote Guest Portal)

2.1 Overview

The guest accesses their booking dashboard using their credentials, browses available upgrades and commodities, and completes an instant prepaid transaction.

2.2 Detailed Action Sequence

Step	User Action (Click/Type)	System Response / Backend Logic
1. Auth	Type registered Email, Phone Number, or Booking ID.	Validate credentials against internal DB and eZee PMS; Grant session access.
2. Dashboard	Successfully log in and view dashboard options (Change Dates, Events, KYC, Add-ons).	Load guest's current itinerary and active booking status.
3. Navigation	Click "Enhance Your Stay" or "Add-ons" button.	Fetch real-time inventory and pricing for commodities (Water Bottle, Towel, Safe Lock, etc.) and services .

4. Selection	Click "Add to Cart" for desired items (e.g., Early Check-in, Toilet Kit).	Update Cart UI. <i>Logic:</i> If "Late Checkout" is selected, apply the discounted pre-booked rate (₹250) versus the higher same-day rate.
5. Checkout	Click "Proceed to Pay".	Generate unique order ID in DB; Redirect to Razorpay Payment Gateway . Temporary hold placed on requested inventory.
6. Payment	Complete transaction via UPI/Card/Wallet on Razorpay.	Await Razorpay webhook confirmation. Upon success, update internal DB payment status to <u>SUCCESS</u> .
7. PMS Sync	<i>(No user action - Background process)</i>	Push the purchased commodities/services to the eZee PMS folio via API. Mark the invoice line items as 'Paid'.
8. Finish	View "Payment Successful" screen.	Display an updated list of purchased add-ons on the guest's dashboard. Send email/WhatsApp receipt.
9. Ops Trigger	<i>(No user action - Background process)</i>	Create actionable tasks in the Staff Task Dashboard (e.g., "Place Bath Towel in Room X") after check-in of Mr.XYZ

3. Product Catalog & Pricing Logic

The following catalog is standard for the Upsell Engine:

- **Commodities:** Water Bottle (₹100), Bath Towel (₹200), Safe Lock (₹150), Toilet Kit (₹150) .
- **Services:** Laundry (₹150), Early Check-in (₹250).
- **Dynamic Pricing Engine:** Late Checkout is priced at ₹250 during the pre-arrival phase. The system must enforce logic where same-day late checkout requests are priced higher than this pre-booked rate.

4. Technical Specifications & Error Handling

4.1 Integration Architecture

- **Inventory Master:** eZee PMS tracks maximum available physical commodities (e.g., total safe locks).
- **Payment Master:** Vibe House custom backend via Razorpay. All small-item transactions strictly enforce a prepaid, instant payment model (no "pay-later" options) .
- **Folio Sync:** Once Razorpay confirms the payment, the Vibe House backend makes a POST request to the eZee PMS API to append the items to the guest's invoice and update the ledger to reflect the external payment.

4.2 Edge Case Handlers

- **Payment Drop-off / Failure:** If Razorpay returns a **FAILED** status or the user abandons the cart, the temporary inventory hold is released after 10 minutes. The PMS folio is *not* updated.
- **PMS Sync Failure:** If the payment succeeds on Razorpay but the eZee PMS API is unresponsive, log the transaction in the Vibe House DB as **SYNC_PENDING**. A cron job will retry the API call every 5 minutes until a **200 OK** response is received from eZee.
- **Inventory Conflict:** If an item goes out of stock between cart addition and payment, Razorpay initialization is blocked, and the user is prompted with an "Item Unavailable" toast notification.

5. Security & Compliance

- **Payment Data:** Vibe House backend does not store any sensitive card or UPI data; tokenization and processing are fully offloaded to Razorpay.
- **Invoice Integrity:** To prevent revenue leakage, operational tasks (like handing over a towel or assigning early check-in) are strictly gated and cannot be generated for staff until the payment webhook validates the transaction.
